Pneumatic actuator of GT valve

I. Functions

Pneumatic actuator of GT valve is driven by compressed air and it is the drive device for starting and closing angle stroke valves such as ball valve and butterfly valve. Besides, it is the ideal device for realizing long-distance concentration of pipelines or separately controlling automatic industrial pipeline.

Electromagnetic valve, positioner (opening position indicator), echo device, filter, pressure reducing valve, various limit switches and hand operating devices.

II. Main technical parameters

1. Medium used: clean, dry and non-corrosive compressed air

2. Working pressure of air source : 0.4~0.7MPa

3. Temperature of working environment: standard: -20℃~+80℃

High temperature type: -20℃~+180℃ (the temperature can reach 200℃ in short time)

4. Rotary angle: 90° ±5°

5. Electromagnetic valve power supply: AC220V/DC24V, or according to customers' needs

6. Output torque: see GTD double acting actuator in Table 1

see GTE spring return actuator in Table 2.

III. Transmission structure principles

When the compressed air enters the pneumatic actuator through Nozzle A (as shown in Fig 1), the air will drive the double piston straightly moving toward two ends (cylinder head end) and the piston rack will drive the gear of the rotary shaft by 90 degrees counter-clockwise. In this case, the valve will be opened. At this moment, the air in both ends of pneumatic actuator is discharged through Nozzle B. On the contrary, when the compressed air entered both ends of the pneumatic actuator through Nozzle B (as shown in Fig 1), the air will drive the double piston to straightly move towards the middle position and the piston rack will drive the gear of the rotary shaft by 90 degrees clockwise. In this case, the valve is closed. At this moment, the air in the middle of the pneumatic actuator is discharged through Nozzle A. What is aforementioned is the transmission principle. According to users' needs, the pneumatic actuator can be equipped with transmission principles contrary to the standard type. In other words, the valve will be opened when the rotary shaft rotates clockwise, while the valve is closed when it rotates counterclockwise.

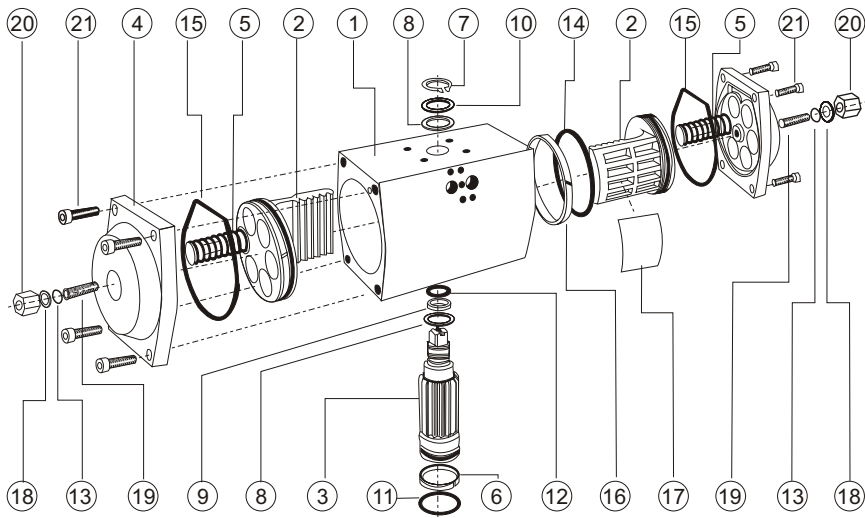

Single acting (spring return type) pneumatic actuation is implemented along the Nozzle A which is the air inlet, while Nozzle B is the air outlet (a muffler shall be installed in the Nozzle B). When Nozzle A inlets air, the valve will be opened, while the valve will be closed by the spring force when the air source is cut off.

IV. Actuator weight/volume/opening or closing time

Double acting type	Volume L	Weight KG	Single acting type	Volume L	Weight KG	Opening or closing time S

VII Selection of GT type

1.Selection of double acting actuator:

Select double acting actuator and look up the torque gage of the double acting torque. Increase 10% safe value according to required torque value. Then look up the torque gage in accordance with the working pressure of the air source to get a proper GT type.

Let's take a valve requiring 200Nm torque, another 10% is added for consideration of safety factors and the torque reaches 220Nm. Then GT127×90° type actuator can be chosen (275Nm torque shall be provided when the pressure is 0.5MPa), or GT118×90° type actuator can be selected (252Nm torque can be provided when the pressure is 0.6 MPa) .

2.Selection of spring return actuator

As regards the selection of the spring return actuator, 20% safe value shall be added according to the required torque value. Then look up a torque value just a little larger than the safe value within the spring torque column in the Spring Return Torque Table. In this case, proper type of the single acting actuator (the value shall be a little larger than the spring torque) can be found in accordance with the working pressure of air source. For instance, to control a valve requiring 80Nm torque, another 20% shall be added and the torque value reaches 96Nm to ensure safety. Look up the 107Nm torque value in the line of GT127×90° K4 inside the column marked with spring torque. Look up the 107Nm torque value inside the column marked with 0.5MPa along this line. The required actuator type is GT127×90° K4 and the required working pressure of air source is 0.5MPa.

VIII. Features

1. With regard to the compact double piston gear-rack type structure, its gear connection is precise with high efficiency and the output torque is constant.
2. Compared with the actuator with the same specification and structure, the weight of aluminum cylinder block, piston and end cap is the lightest.
3. The cylinder block is made from extruded aluminum alloy and it is processed by hard anodic oxidation. The inner surface is very hard with high strength. Sliding bearing made from low friction materials is applied to avoid direct contact of metals with each other. The friction coefficient is low and the cylinder block can be flexibly rotated with long service life.
4. Pneumatic actuator and valve connection meet the ISO5211 standard.
5. The air source hole meets the NAMUR standard.
6. The bottom shaft hole of pneumatic actuator (meeting the ISO5211 standard) is a square pair, to be convenient for the linear installation or 45 degree angle installation of square bar valves.
7. The top and bottom hole of the output shaft meet the NAMUR standard.
8. Regulating screws in both ends can adjust the opening angle of valves.
9. Double and single acting (spring return) have the same specifications.
10. The direction (clockwise or counterclockwise rotation) can be decided according to the needs of valves.
11. Install electromagnetic valve, positioner (opening indicator), echo device, various limit switches and hand operating devices according to users' needs.

IX. Installation, debugging, operation and maintenance

1. GT pneumatic actuator and valve connection meet the ISO5211 standard, while they can be directly connected with valves. Furthermore, they can be connected with all valves through transition support and connection.
2. It shall be ensured that the rotary shaft of pneumatic actuator and valve shaft are coaxial during installation.
3. The nozzle and pipe shall be cleaned without any redundant things, dust and oil dust, etc inside.
4. Copper tube or nylon tube can be applied for the connection of pneumatic actuator, electromagnetic valve, positioner and pressure reducing valve, etc. To prevent dust and reduce noise, the muffler or muffler throttle valve shall be installed at the air outlet.
5. Regulating screws in both ends of pneumatic actuator can slightly adjust the opening angle of valves. After regulation, the nut shall be screwed up.
6. After installation, the pneumatic actuator and valve shall be simultaneously tested, while the pressure of the valve shall be increased to the rated pressure. The pneumatic actuator switches air inflow of its two air inlets by air source pressure ranging from 0.4 to 0.7MPa, observing the opening and closing conditions of the valve. It shall be flexibly rotated with no jamming phenomena, while tests shall be repetitively carried out.
7. As regards the installation of the pneumatic actuator of the electromagnetic valve, the hand operating device shall be applied first for debugging (pressing the red button of the electromagnetic valve). Then the power shall be switched on for the debugging.
8. The pneumatic actuator shall be regularly maintained, while the water of the air filter used with the pneumatic actuator shall be regularly discharged and drained. Under normal conditions, it shall be tested once every six months and overhauled once per year.

Limit switch (accessory)

I. Product features

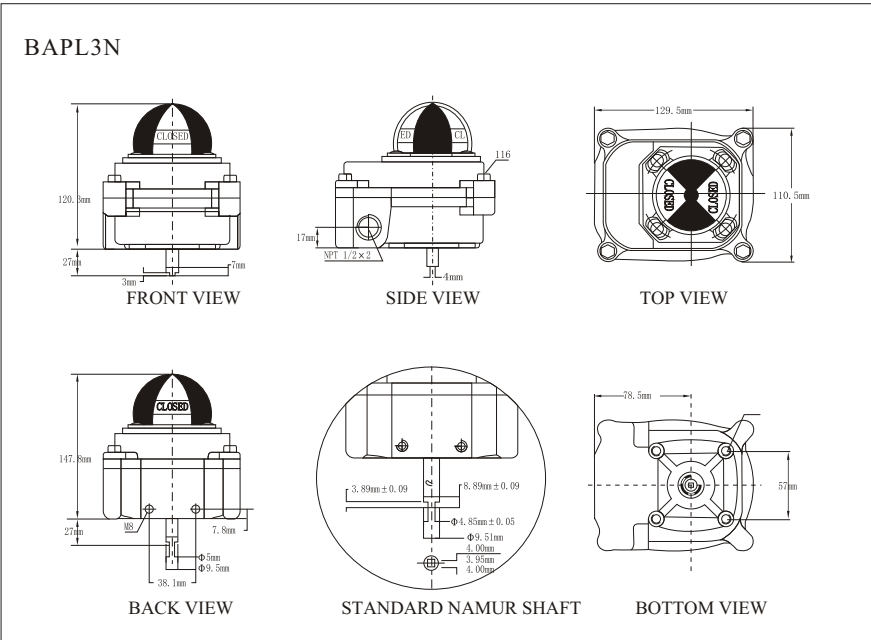

- Die-casting aluminum alloy shell is processed by powder coating. It is aesthetic in appearance and reliable in quality.
- The switch position can clearly be identified by indicator.
- Quickset cam is installed by spline shaft and spring, while it is very convenient to be adjusted without use of any tools.
- Terminal block with multiple points has 8 standard contact points. The wiring is safe and convenient.
- Standard wiring interfaces
- Anti-drop bolts won't fall off when they are attached to the upper cap during disassembly or installation.
- It can be conveniently installed. The stainless steel main shaft connection and installation bracket meet the NAMUR standard.

III.dimension diagram

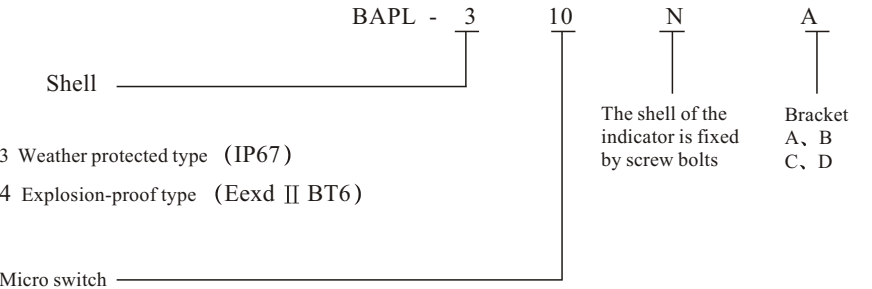

Technical drawing of the 'closed' position of the device. The drawing shows a cross-section of a multi-layered cylindrical assembly. A central vertical axis is indicated. The top part is a dome-shaped cap labeled 'closed'. Dimensions include a total height of 17mm and a base diameter of 13mm. A small horizontal dimension of 7mm is also shown.

10 2-SPDT	20 P&F.NJ2-V3-N	30 General type
11 3-SPDT	21 Autonics.PS17-50DNU	31 Wenzhou type (0~100℃)
12 4-SPDT	22 P&F.NJ412GM-N	
13 2-SPST	23 NBB2-V3	
14 2-DPDT		
15 2-SPDT+Potentiometer		
16 2-SPDT+Current feedback (4-20mA)		

VI. Micro switch

Mechanical switch Single-pole, double-throw			
DC	AC	Standards met	
0.6A.125VDC	16A.250VAC	UL(E177511) CSA(LR68515-6)	SWMC0(97111051-03) VDE(9242.3-4401-1001)
mechanical switch 2SPDT, single-pole, double-flow			
DC	AC	Temperature	Meeting standards
0.5A.250VDC	20A.125/250VAC	-40℃~85℃	UL1054
Inductive switch (safety type)			
Type	Voltage	Operating distance	
P & FNJ2-V3-N	0~25VDC	2mm	
PS17-5DNU	10~30VDC	5mm	

VII. Bracket A、B、C、D

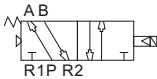

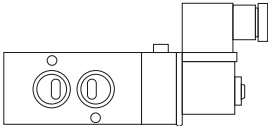

30×80 H: 20~30 30×130 H: 30~50 30×80 H: 30 30×130 H: 30

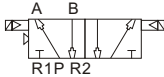

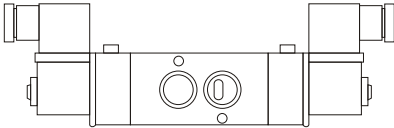

Used for ordinary limit switch
(installed on both sides)

Used for explosion-proof limit switch
(installed at the bottom)

Electromagnet valve (accessory)

Single electricity control

Double electricity control

I. Type description

3V	—	1	10	—	06	—	AC110V
		Code :			Diameter of nozzle		
		100			M5 : M5 × 0.8		
		200			06: 1/8 "		
		300			08:1/4 "		
		400			10:1/8 "		
					15:1/2 "		
Type			Type			Standard voltage	
3V : wo-position			10 : single-coil double-position			DC12V	
three-way			20 : double-coil double-position			DC24V	
5V : two-position			30C : double-coil three-position			AC24V 50/60HZ	
five-way			closed type			AC110V 50/60HZ	
			30E : double-coil three-position			AC220V 50/60HZ	
			open type				
			30P : double-coil three-position				
			pressure type				

II. Technical parameters

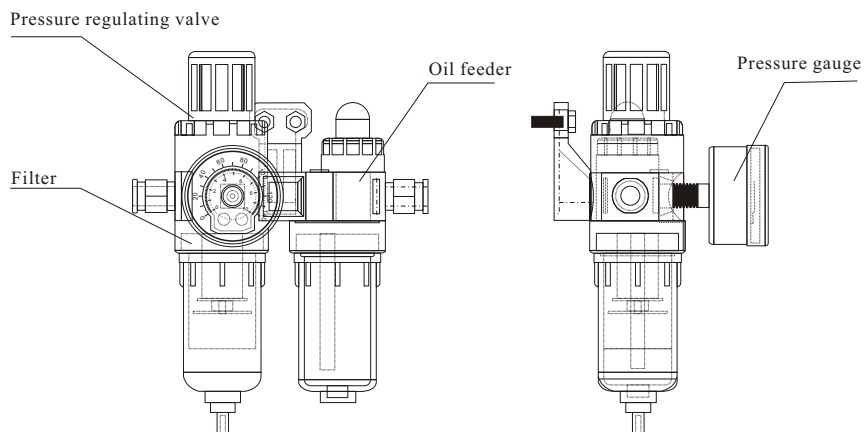

说明: illustration

Specifications		Illustration
Fluid used		Air (filtered by 40 μ m filter net)
Mode of action		Internal guide type
Lubrication		Unnecessary
Pressure used		0.15~0.8MPa(1.5~8.0Bar)(21~114psi)
Operating pressure ℃		-5~60
On pressure Range	100	± 10%
	1/3/4	-15%~+10%
Electric power consumpti	100	DC: 2.5W AC: 3.0VA
	1/3/4	DC24:3.0W AC220V:2.0VA AC110V:2.5VA
Insulation		B Class
Service life		About 10 million times under normal conditions
Max function frequency	3V1/2/300	5
	4V100	4V110、 4V120 specifications : 5 4V130 specifications ; 3
	4V200	4V110、 4V220 specifications : 5 4V230 specifications ; 3
	4V300	4V310、 4V320 specifications : 4 4V330 specifications ; 3
	4V400	3
Excitation time (sec)		≤0.05

III. Operation and maintenance precautions

1. Please check whether the components are damaged or not during transportation before installation for use.
2. During installation, please check whether the air flow direction and connection tube are right or not.
3. During installation, please specially note whether the voltage meets the requirement or not. When the whole machine is debugged, you are recommended to apply the hand operating device first for debugging and then switch on the equipment for debugging.
4. Please pay attention to road dust and it is recommended that the muffler device or muffler throttle valve shall be installed at the air outlet.
5. During the connection of pipelines, please note that the thread seal tape shall not be intertwined over the tooth end face. Meanwhile, please remove the metal particles, dust and oil stain, etc of the pipe fitting and inside the pipe.

Air source triplet (accessory)

I. technical parameters

Type		AC1500	AFC1500	AC2000	AFC2000
Working medium		Air			
Diameter of nipple		1/8 ”		1/4 ”	
Filter element precision		40 μ			
Pressure range		Manual drain: 0.05~0.85MPa			
Maximum adjustable pressure		0.95MPa			
Insurance of pressure resistant		1.5MPa			
Temperature range		5~60℃			
Volume of water filter cup		15CC			
Volume of oil feeding cup		25CC			
Lubricating oil recommended		ISO VG32 Or oil with the same grade			
Weight		0.7kg	0.5kg	0.7kg	0.5kg
Components	Filter	AF1500	AFR1500	AF2000	AFR1500
	Pressure regulating valve	AR1500		AR2000	
	Oil feeder	AL1500	AL1500	AL2000	AL2000

II. Installation

During installation, please clean connection pipelines and connectors to prevent the dirt from being brought into the air channel

During installation, please note whether the air flow direction is coherent with the direction of the arrow in the main body. Please make sure if the pipeline and tooth-type connector is proper or not.

The fixation of filter, pressure regulating valve (pressure regulating filter) and oil feeder: match the convex groove of the fixing bracket with the concave groove of the main body. Then tighten it with fixing piece and screw.

As regards the fixation when pressure regulating valve and pressure regulating filter are separately applied, just rotate the fixing ring to tighten the accessory special fixing piece up.

III. Water output (filter)

The water output of the filter can be automatically implemented by differential pressure. Meanwhile it can be manually implemented.

Water discharged by manual operation: the water shall be discharged before the water level reaches the level under the filter holder.

IV. Pressure regulation (filter)

Lift the rotary button up before tuning it and press the button to locate.

Turn the rotary button to the right direction to increase the outlet pressure and turn it to the left direction to reduce the outlet pressure.

During the pressure regulation, the pressure shall be gradually and evenly regulated to the required value and it is infeasible to regulate it at a stroke.

V. Approaches to feed oil and oil amount regulation (oil feeder)

The JIS K2213 engine oil (ISO VG32 or oil with the same grade) is applied to the oil feeder. The oil amount shall not exceed 4/5 volume of the cup.

The oil amount is the minimum when the number is zero and it reaches the maximum when the number is 9. The number shall point at the ▲ arrow direction. It can't be rotated in the position of the number ranging from 9 to 0 and it shall be rotated clockwise.

VI. Operation precautions

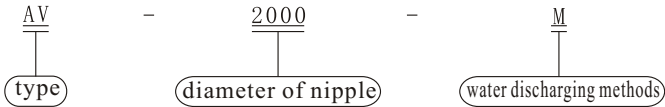

Some components are made from PC materials, while they are prohibited from being close to or being used in organic solvents.

The pressure used shall not exceed 0.95MPa.

The filter element shall be promptly changed when there is an obvious decrease of outlet air volume.

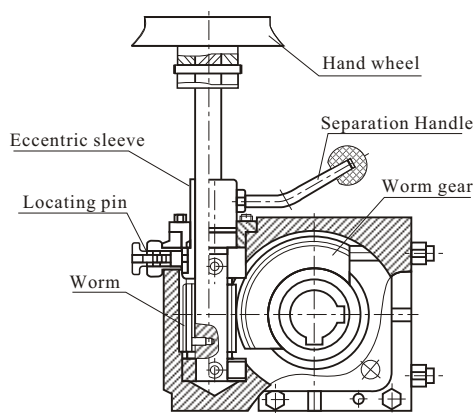

For other detailed materials, please refer to the product sample.

VII. Order code

AC: middle-sized triplet AC: middle-sized triplet 1500: 1/8" Blank: differential pressure drain type
AFC: middle-sized air source treatment unit 2000: 1/4" M: standard manual drain type

Hand operating mechanism (accessory)

I. Main functions

This speed reducer is used with pneumatic devices to open 90-degree butterfly valve, ball valve and plug valve, etc to realize manual or pneumatic drive.

II. Features

It is small and light-weighted with reasonable designs and novel styles.

The product is serialized, while the output torque and pneumatic devices match with various valves.

There are two key grooves vertical to each other inside the inner holes connecting worm wheels, so as to be convenient for users to choose relative places for the same valve body of devices according to their needs.

Lift the locating pin up and rotate the separation handle by 180 degrees. The locating pin automatically set position for itself to realize pneumatic operation. On the contrary, manual operation is realized.

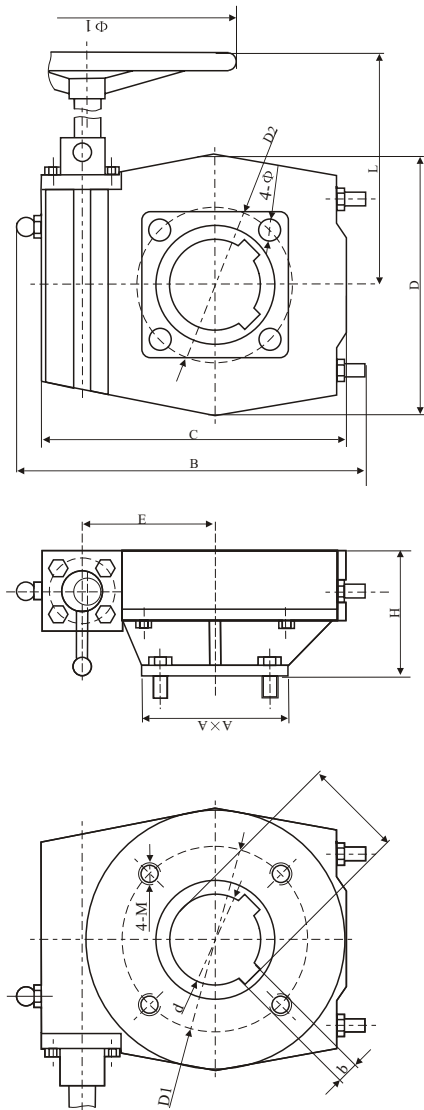

When the product leaves the factory, special lubricating grease is equipped. After it is equipped with valves, all of these are sealed as a whole. The dust-proof, water-proof and protection level is IP65.

III. Operation instructions

In terms of the connection of the speed reducer bottom with valve, the bracket surface is connected with the cylinder, while the valve shaft passes through the inner holes. The four sides of valve shaft ends work in with the square hole of the cylinder. (Operation process: during pneumatic operation, the cylinder drives the valve shaft and the worm gear rotates as well. During manual operation, the worm joggles with the worm gear, driving the valve shaft to rotate, while the cylinder piston rotates as well.)

When the worm is closed by the revolving handle (rotated by 180 degrees outward), gear interference phenomenon will emerge. In this case, it is necessary to rotate the hand wheel by certain degree.

The pneumatic and manual operation can't be simultaneously implemented.

Connecting dimensions of hand-operating mechanism:
